

TEAM PROJECT PRESENTATION • 2026

EVERYWHEREHOME

A modern platform for accommodations & travel

React

TypeScript

ASP.NET Core

EF Core

SQL Server / PostgreSQL

What is EverywhereHome?

The Core Concept

- ✓ Digital platform for accommodations search & booking
- ✓ Hosts create, edit, and manage listings
- ✓ Admin tools for users, reports, and support
- ✓ Clean, modern, and fully responsive UI

Guest / Traveler

Search • Book • Pay • Favorites

Host

Accommodations • Photos • Bookings

Administrator

Users • Reports • Support

Clear separation between frontend, API, and data access

Frontend

React + TypeScript, Vite, React Router, Responsive UI

Backend API

ASP.NET Core Web API, Application & Infrastructure layers, JWT, Identity

Database

Entity Framework Core, SQL Server / PostgreSQL, Migrations & Seeders

Application → Infrastructure → API | Business logic stays in service – Controllers handle HTTP requests.

React Application with TypeScript and Vite

Key Feature Areas

- ✓ Homepage with search, filters, categories & pagination
- ✓ Listing details with photos, amenities, and booking engine
- ✓ Authentication: Login / Registration & Google Login
- ✓ User profiles, favorites, messaging, and payment views
- ✓ Host & Admin management dashboards

Technical Stack

React 19 • Component-driven architecture

TypeScript 5.9 • Type safety

Vite 7 • Lightning-fast builds

React Router 7 • Dynamic routing

CSS / Responsive • Modern styling

ASP.NET Core Web API with Modular Structure

Project.Application

Entities, DTOs, interfaces, and business contracts.

Project.Infrastructure

EF Core, database access, services, file handling, authentication.

Project.Api

Controllers, HTTP endpoints, configuration, middleware, startup logic.

Example API Endpoints:

Auth • Listings • Bookings • Favorites • Messages • Reviews • Reports • Host • Admin • Profile

Central Business Objects & Relationships

AppUser

User / Host account

Listing

Accommodation property

Booking

Reservation record

Payment

Transaction status

Ratings & feedback

Favorite

Saved listings

EF Core seamlessly handles entity mapping, database relationships, and automated migrations.

From Search to Confirmed Booking

The booking logic validates capacity, checks for date overlaps, and verifies accommodation availability.

Protected Areas & Token-Based Access

Authentication Architecture

- 🛡️ ASP.NET Core Identity accounts
- 🛡️ JWT Bearer Authentication
- 🛡️ Password checks via UserManager
- 🛡️ Role authorization with [Authorize]
- 🛡️ Optional Google OAuth login

Security Measures

- 🔒 Protected actions require valid session
- 🔒 Data ownership verification for bookings/hosts
- 🔒 Strict file upload limits & validation
- 🔒 Centralized CORS & static file configuration

More than just a search and booking platform

Host Features

- ✓ View and manage own listings
- ✓ Add property details, price & categories
- ✓ Upload and delete property photos
- ✓ Host application onboarding process

Admin Features

- ✓ Comprehensive admin dashboard
- ✓ User & listing management
- ✓ Review host applications & reports
- ✓ Support ticket management

Ukrainian & English directly in the frontend

Language Switcher

 Українська

 English

Accessible top right. Selected language is saved locally in the browser.

User Experience

- ✓ Shared app layout & responsive design
- ✓ Central translation function & clean errors
- ✓ Modular React components
- ✓ Vite proxy for seamless local API development

10. CONCLUSION

EverywhereHome combines search, booking, and management

What the project demonstrates:

- ✓ Full-stack development with React & ASP.NET Core
- ✓ Robust authentication, booking logic & data persistence
- ✓ Clean architectural separation of business logic and API
- ✓ Scalable structure for additional features

Thank you for your attention!
